APL-C-900 Electrical Capacitance Tomography Process Imaging Research System

The APL-C-900 series is a revolutionary system that is capable of providing cross-sectional images of fluid processes including concentration and velocity of mixtures of non-conducting fluids and solids. The table below outlines possible application areas. The first column indicates the process materials, with the continuous phase noted first. Please note that the performance of each system may vary between different fluid combinations and that no guarantees of performance can be given for such novel technology.

Note that Atout has an active programme of product development and specifications may change at any time

APL-C-900 Electrical Capacitance Tomography  
Process Imaging Research System

The APL-C-900 is a high-speed twin-plane ECT system suitable for non-invasive measurements of non-conducting two-phase flows containing twin-plane ECT measurement electronics:

- Able to measure 56 independent capacitances on each 8 electrode sensor plane,
- Resolution better than 0.01 fF,
- Stability better than 0.2 fF,
- Temperature compensation built-in,
- Acquisition rate (2 planes, 56 measurements per plane) > 3000 complete frames per second,
- Full guarding on each plane - total up to 32 driven electrodes including 16 measurements channels,
- smb connectors to sensor leads,
- Ethernet connection to PC,
- 100-250V AC single phase power supply.

APL-C-900 Base System

The APL-C-900 base system is required for all Atout ECT systems. It incorporates the power supply and ethernet communication bus and includes the control PC (laptop) and the powerful range of APL software including:

Data acquisition (real-time) software:
- multi-frequency operation 1MHz, 2.5MHz, 5 MHz square wave,
- acquire and display capacitances in fF in real-time,
- save data in .bcp format and .csv format,
- capable of undertaking calibration in rig without sensor removal,
- save and load calibration files as required.

Data analysis software:
- able to read .bcp files and display images and time series data,
- capable of calculating permittivity, concentration and density from capacitance images,
- undertake cross-correlation between user-specified zones, plot velocity in each plane,
- built-in permittivity to concentration models to include parallel, series, maxwell and extended maxwell-wagner-sillars,
- output time-series and zonal data to .csv format.

Flow rate calculation can be made using cross-correlation between zones in two planes, output in two-phase flows to include average concentration, velocity and volumetric flow rate.

APL-C-900 Capacitance Measurement Unit

The APL-C-900 CMU is a completely new capacitance measurement unit for our powerful electrical capacitance tomography system. Coupled to a suitable APL sensor, and with the APL-C-900 base system, the concentration distribution of non-conducting fluid-fluid or fluid-solids flows can be derived on two planes axially separated along the pipe. Images from the two planes are cross-correlated to provide flow structure velocity images. See references [1], [2] and [3] for further technical background.

APL-S Sensor Heads

The APL-S series of sensor heads are twin-plane clamp-on sensors to fit to existing plastic pipe:
- 8 independent segments fitted around pipe allowing sensor to be separated between any electrode pair,
- two measurement planes and 3 guard electrodes per segment,
- measurement electrode length < 35mm, plane separation 60 to 70mm centre-to-centre,
- overall driven guard length (including embedded measurement planes) >200mm,
- overall sensor length < 350mm,
- smb connectors to each measurement electrode and set of guard electrodes,
- factory calibration supplied for material permittivities 1.0 to 7.5.
